Discrete Patterns

- Discrete features that characterize a piece of text
 - e.g., sentiment, template.
- Discrete pattern recognition often brings about **interpretability** and **controllability**, which are in desperate need.
 - They also solve diversity and informativeness

a sequence of latent variables

Source Entity: Cotto

type[coffee shop], rating[3 out of 5],
food[English], area[city centre],
price[moderate], near[The Portland Arms]

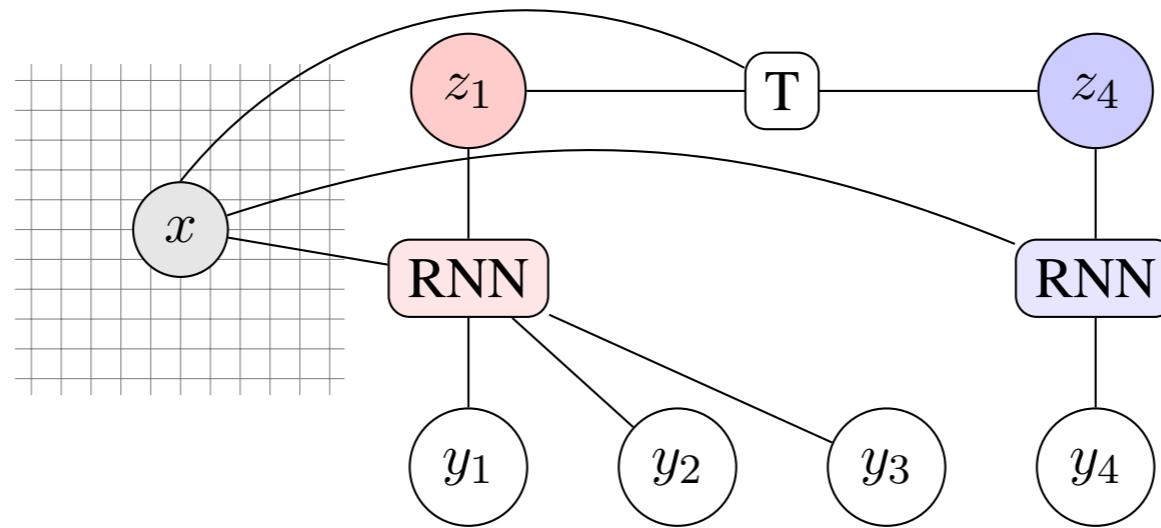

System Generation:

Cotto is a coffee shop serving English food
in the moderate price range. It is located
near The Portland Arms. Its customer rating is
3 out of 5.

Neural Template:

The	—	is a	providing	
—		is an	serving	
...		expensive	offering	—
		...		
food	in the	price range	...	
cuisine	with a	price bracket	.	It's
foods	and has a	pricing	.	It is
...	...			The place is
located in the	Its customer rating is	
located near	near	Their customer rating is	—	
...		Customers have rated it	—	.

a sequence of latent variables

$$\begin{aligned} p(y, z, l, f \mid x; \theta) &= \prod_{t=0}^{T-1} p(z_{t+1}, l_{t+1} \mid z_t, l_t, x)^{f_t} \\ &\times \prod_{t=1}^T p(y_{t-l_t+1:t} \mid z_t, l_t, x)^{f_t}, \end{aligned}$$

Model Details (state transition)

$$\begin{array}{c} p(z_{t+1}, l_{t+1} | z_t, l_t, x) \\ \downarrow \\ p(z_{t+1} | z_t, x) \times p(l_{t+1} | z_{t+1}) \\ \searrow \quad \swarrow \\ p(z_{t+1} | z_t, x) \propto AB + C(x_u)D(x_u) \end{array}$$

Length Distribution We simply fix all length probabilities $p(l_{t+1} | z_{t+1})$ to be uniform up to a maximum length L .¹

Model Details (Emission)

$$\begin{aligned} p(y_{t-l_t+1:t} \mid z_t = k, l_t = l, x) &= \\ \prod_{i=1}^{l_t} p(y_{t-l_t+i} \mid y_{t-l_t+1:t-l_t+i-1}, z_t = k, x) & \\ \times p(</\text{seg}> \mid y_{t-l_t+1:t}, z_t = k, x) \times \mathbf{1}_{\{l_t = l\}} & \end{aligned}$$

An Autoregressive Variant

$$p(y_{t-l_t+i} = w \mid y_{1:t-l_t+i-1}, z_t = k, x)$$
